

1st on the Peninsula

Forks Community Hospital has joined UW, Harbor View, Evergreen, Overlake, and Virginia Mason by offering the Bardy CAM Patch for quality a cardiac data recording, and diagnostics.

Better Quality

The CAM Patch has less noise in the report and catches both the P and R waves with incredible accuracy.

Patient Control

The patient can press a button adding a marker to the report when they experience a symptom.

Comfortable

The patch's unique hour glass design can be worn discreetly by women, men, and children.

Download Portal

The patch attaches to a portal that uploads data to a secure network. This cuts turn around time down by 7 days when compared to all other monitoring systems.

Bardy Carnation Ambulatory Monitor Patch

"Developed on the principle that non-invasive cardiac monitoring should provide an excellent quality atrial signal, the CAM is designed to be placed along the sternum—over the heart—to optimize P-wave signal capture. The result is improved ECG resolution, providing more information about the heart rhythm which may lead to more clinically actionable diagnoses."

Why Choose Us

- The CAM patch can be applied at Forks Community Hospital during a short 20 to 30 minute appointment. The patch is placed on the sternum directly over the atrium allowing for an unparalleled P Wave reading. The patch can be worn for up to 7 days, including while you work out or are in the shower. Other patches have to be worn for 14 days and do not have as accurate of a recording. Unlike all of the competitors, this patch does not have to be mailed off. The information is stored in the patch and directly uploaded into the portal. The report turn around time is lessened by seven days. Patients have the option to press a button, marking the report when they experience symptoms.
